TITLE : DEVICE FOR EDITING SCENARIO

**ABSTRACT :** PROBLEM TO BE SOLVED: To judge whether or not data can be stored in a prescribed medium such as a CD-ROM in the stage of scenario preparation on the early stage of application development by calculating an actual media data size based on media depending attribute, adding each size and estimating the size of a whole application.

**SOLUTION:** This device is provided with a sketch inputting part 11, a scene managing part 12, a substitute media managing part 13, a substrate media list part 14 and a media attribute inputting part 15 or the like. A graphic media is registered as an animation to be prepared afterward, and an actual media such as a voice is registered as a substrate media to be temporarily indicated, and the substitute media is displayed in a list with a thumb nail. Then, in the thumb nail display part of the substrate media, a user is allowed to input the media depending attribute such as the size, the number of display colors, the number of samples, time length, and compressibility of the actual media to be prepared, the actual media data size is calculated based on the media depending attribute, each media size is added, and the size estimation of the whole application is calculated and displayed.
